

Drinking water supply and sanitation services in Mvomekak II

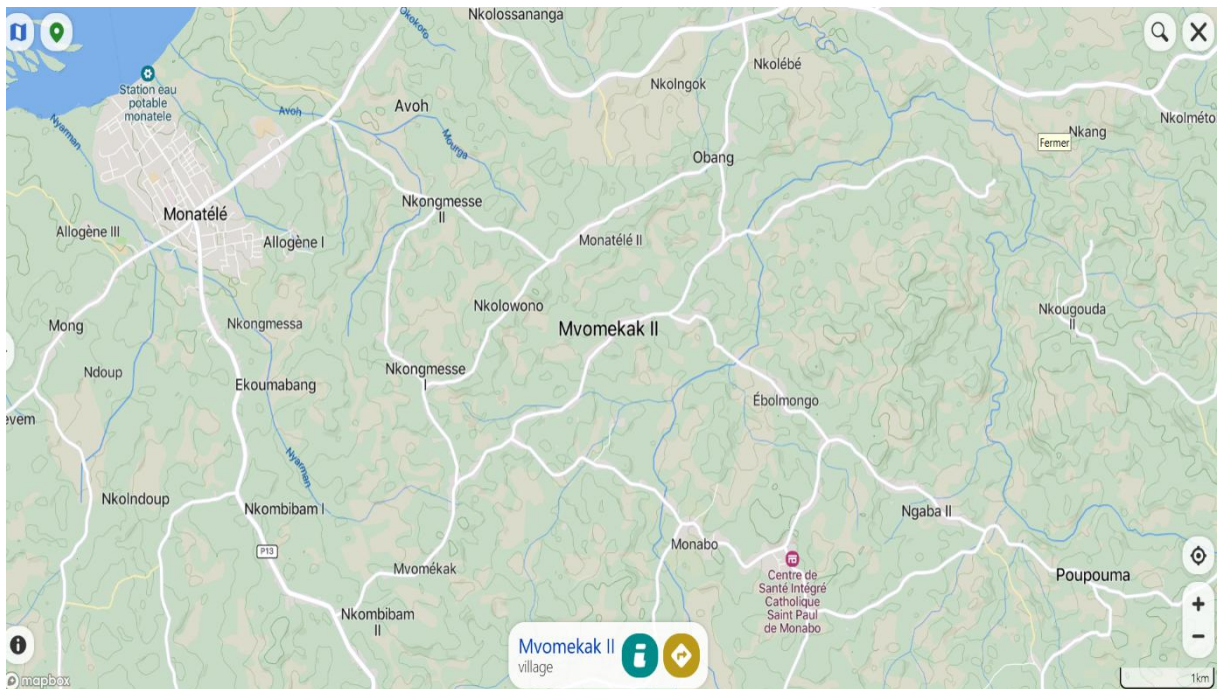

Figure 1: Map of Mvomekak II

Mvomekak 2, village located in the Arrondissement of Monatéle, in the Department of Lékié, Central Region of Cameroon.

Many efforts of the CAMWATER-Regional Delegation of the Centre (DRC), with the installation of the 75 KVA generator set at the Monatéle plant on Wednesday, December 11, 2024,

Figure 2: Acquisition of the Generator Set

Figure 3: Installation of the Generator Set

This generator is part of a large stock of equipment recently acquired and deployed in several other factories, including in Eséka, Makak and Mfou.

The objective of the installation of these generators is to stabilize the production of drinking water in localities affected by recurrent power cuts and which disrupt the optimal operation of water treatment plants.

Despite its many efforts by the Government and CAMWATER, Mvomekak 2 faces many challenges such as the supply of drinking water and sanitation services in rural areas, namely: absence of public drinking water supply points (boreholes, good fountains), absence of public latrines, open defecation, waterborne diseases

Climate change is also having an impact on the drinking water and sanitation sector in Mvomekak 2 with the drying up of the village's rivers, and the decrease in watercourses

The populations of Mvomekak 2 travel long distances to obtain the precious liquid that is drinking water, which is why the said populations are seeking the intervention of International Partners (Donors), International NGOs, and the Private Sector for the establishment of public drinking water supply points (boreholes, good fountains) and public latrines (public toilets)
